A detailed report has been made including statistics on young growth and merchantable timber located in the approximately 39.84 acres.

The existing forest on the property is primarily forested with Douglas fir, western hemlock, Grand fir and red alder tree species. The primary forest type is a medium to well-stocked stand of Douglas fir. The range in age is from 45 to 60 years.

There are no immediate plans for harvesting timber. Our plan is to continue to monitor and assess the log grade estimates, and local log delivered prices paid by local mills. A moderate, conservative approach is preferred for future logging.

We plan to maintain a healthy forest by removing diseased trees. Pre-merchantable timber stands which are below age 30 will be allowed to mature and increase.
